AN 2005-091810 [10] WPI/D

AB WO 2005003336 A2 UPAB: 20050708

NOVELTY - An isolated polypeptide comprising one or more amino acid motifs selected from a sequence with at least 80% identity to (I), (II), or (III), is new.

DETAILED DESCRIPTION - A new isolated polypeptide comprises one or more amino acid motifs selected from a sequence with at least 80 % identity to (I), (II) or (III).

Pro-Leu-X-Asp-X(35,75)-Arg-Arg-X(8)-(TyrPhe)-X(2)-Arg-X(6)-Thr (I)
Cys-X-Asp-X(3)-Ser-Gly-His-Thr (II)

His-Tyr-(ThrSer)-X-Asp-(ValIle)-X(3)-(PheTyrIle)-X(6)-Phe-X(2)-Tyr-
His (III)

INDEPENDENT CLAIMS are included for the following:

(1) a nucleotide sequence selected from the group consisting of a nucleotide sequence coding for I, II, III, and an antisense nucleotide sequence that is complementary to it;

(2) a plasmid comprising the nucleotide sequence;

(3) a vector comprising the nucleotide sequence;

(4) a microorganism or cell line in which the nucleotide sequence was introduced;

(5) a process for producing ***sphingomyelin***
synthase comprising the expressing any one of the nucleotide sequences in the microorganism or cell line and isolating the
sphingomyelin ***synthase*** ;

(6) a process for producing ethanolamine phosphorylceramide or ethanolamine phosphorylceramide synthase comprising expressing any one of the nucleotide sequence in the microorganism or cell line and isolating ethanolamine phosphorylceramide or ethanolamine phosphorylceramide synthase;

(7) a process for producing phosphatidylglycoprotein
cholinephosphotransferase or phosphatidylglycolipid
cholinephosphotransferase comprising expressing any one of the corresponding nucleotide sequences in the microorganism or cell line and isolating phosphatidylglycoprotein ***cholinephosphotransferase*** or phosphatidylglycolipid ***cholinephosphotransferase*** ;

(8) a process for producing phosphorylcholine-substituted glycoprotein or phosphorylcholine-substituted glycolipid comprising expressing any one of the corresponding nucleotide sequences in the microorganism or cell line and isolating phosphorylcholine-substituted glycoprotein or phosphorylcholine-substituted glycolipid;

(9) a process to isolate candidates for functional genes of a previously unidentified enzyme with known activity from a huge database by combining at least four characteristics based on data from bio-informatics and from biochemistry;

(10) determining whether a compound is capable of modulating an enzymatic activity displayed by a cell, the activity comprising an activity of an enzyme of the group of enzymes identified as sphingomyelin synthases, ethanolamine phosphorylceramide synthases, phosphatidylcholineglycoprotein ***cholinephosphotransferase*** and phosphatidylcholineglycolipid ***cholinephosphotransferase*** , the method comprising:

(a) providing the cell with a nucleic acid encoding the polypeptide;

(b) contacting the cell with the compound; and

(c) determining whether the enzymatic activity is modulated;

(11) a method for at least in part improving the yield of an secretion product of a cell comprising providing the cell with the

polypeptide, nucleic acid, its functional part, derivative or homolog; and
(12) targeting a first polypeptide to a different cellular compartment comprising providing a cytosolic part of the first polypeptide with a cellular compartment localization signal of a cytosolic part of a second polypeptide.

ACTIVITY - Cytostatic; Metabolic-Gen; Antiparasitic. No biological data given.

MECHANISM OF ACTION - Gene therapy;

Cholinephosphotransferase; Ethanolaminephosphotransferase;

Sphingomyelin synthase*** inhibitor.

USE - The polypeptide and nucleotide sequences are useful in medicine, specifically for the manufacture of medicaments for treating a disease, such as cancer, metabolic diseases or disease caused by parasites. They are also useful in influencing equilibrium reactions, and to identify or develop compounds influencing those reactions. The nucleic acid is useful as a probe, for assessing whether a cell comprises

sphingomyelin synthase*** activity, and for enhancing cell survival and/or cell growth. The oligonucleotide specific for the nucleic acid sequence is useful for detecting the sequence. The inhibitor of ***sphingomyelin*** synthase*** is useful as a cell death promoter, the cell being a parasite or human cell (all claimed).

AB Engineered strains of the oleaginous ***yeast*** *Yarrowia lipolytica* capable of producing greater than 50 weight percent of eicosapentaenoic acid ("EPA"), an omega-3 polyunsaturated fatty acid, in the total oil fraction are described. These strains over-express heterologous DELTA.9 elongases, DELTA.8 desaturases, DELTA.5 desaturases, DELTA.17 desaturases, DELTA.12 desaturases and C.sub.16/18 elongases, and optionally over-express diacylglycerol cholinephosphotransferases. Preferred gene knockouts are also described. Production host cells, methods for producing EPA within said host cells, and products comprising EPA from the optimized *Yarrowia lipolytica* strains are claimed.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB Particular aspects provide six novel *Ricinus communis* cDNA clones, including cloned sequences of DGAT (RcDGAT1 and RcDGAT2); RcLPAT; LACS (RcLACS4), and PDAT (RcPDAT1A and RcPDAT1B). Additional aspects provide methods for substantially enhanced accumulation of hydroxy fatty acid (HFA) in transgenic plant tissue (e.g., seeds), comprising expression of particular novel sequences. For example, expression of RcDGAT2 or RcPDAT1 in castor hydroxylase-expressing *Arabidopsis* lines resulted in

substantially enhanced accumulation of hydroxy fatty acid (HFA) (e.g., to over 30%; a 50-70% increase in HFA accumulation) relative to the hydroxylase-only expressing parental lines. Further aspects provide methods to increase at least one of total lipid content, percent seed germination, and seed weight in transgenic plants, comprising expression of RcdGAT2 in castor hydroxylase-expressing plant lines. Yet further aspects provide methods for expressing and accumulating hydroxyl fatty acid in ***yeast*** (e.g., TAG biosynthesis from diricinolein), comprising expression of RcdGAT2 RcdGAT2 coding sequences in ***yeast***.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB This invention provides compositions and methods to identify candidate agents capable of altering the biological activity of a polypeptide encoded by a polynucleotide involved in hypoxia-related tumorigenesis. In one aspect, the biological activity is the induction of hypoxia-related gene enolase 2 or a biological equivalent thereof. In another aspect, the biological activity is the induction of a hypoxia-related gene, inducible in the absence of the von Hippel-Lindau tumor suppressor (VHL). In yet a further aspect, the biological activity is differential expression in a neoplastic cell under hypoxia. In an alternative aspect, the biological activity is induction of a gene that is inducible in the absence of VHL, but not hypoxia.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

phosphocholine and phosphoethanolamine, nucleotide sequences coding for
any of these polypeptides and nucleotide sequences complementary
thereto, plasmids, vectors and a (micro)organism or cell comprising said
nucleotide sequences. Furthermore, the present invention relates to
processes to produce cholinephosphotransferases and

ethanolaminephosphotransferases like sphingomyelin synthase, ethanolamine phosphoglyceramide synthase, phosphatidylcholine:glycoprotein cholinephosphotransferase and phosphatidylcholine:glycolipid cholinephosphotransferase. The present invention also provides the application of said nucleotide sequences to influence the equilibrium reactions or to develop compounds influencing the equilibrium reactions wherein said transferases are involved and the application of said compounds in medical use. Finally, a process has been provided to isolate candidates for functional genes of a previously unidentified enzyme from a large database by isolating candidates for functional genes of a previously unidentified

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB We report the first cloning and expression, from a mammalian source, of proteins capable of catalyzing choline- and ethanolaminephosphotransferase reactions (hCEPT1 and hCEPT2). Both coding regions predict highly hydrophobic proteins of 43-46.5 kDa with several predicted membrane spanning domains. A CDP-alcohol phosphotransferase motif, DG(x)2AR(x)8G(x)3D(x)3D, has been identified in both hCEPT1 and hCEPT2 choline- and ethanolamine-phosphotransferases (and several other lipid synthesizing enzymes that catalyze the formation of a phosphoester bond by the displacement of CMP from a CDP-alcohol by a second alcohol). Site-directed mutagenesis was used to differentiate the residues responsible for choline- versus ethanolamine-phosphotransferase activity. Mutation of glycine 156 of

hCEPT1 abolished ethanolaminephosphotransferase activity, while
cholinephosphotransferase activity remained intact.

AB The present invention provides a novel class of antisense
oligonucleotides capable of hybridizing to and ***inhibiting***
expression of nucleic acids having mixed purine/pyrimidine sequences by
triplex formation. The foldback triplex-forming oligonucleotides (FTOs)
of the invention are comprised of three regions, a duplex-forming
region, which is sufficiently complementary to a region of the target
nucleic acid to hybridizes to it under the conditions of interest, a
triplex-forming region, which is an inverted repeat of the
duplex-forming region and folds back upon the duplex formed between the
duplex-forming region and the target nucleic acid to form a triplex, and
a linker region, which connects the duplex-forming region and the
triplex-forming region and allows formation of the triplex. A novel
aspect of the FTOs of the present invention is that from one to five
abasic linkers substitute for nucleotides in the triplex-forming region
and are positioned to match up with pyrimidine residues of the target
when a triplex is formed. This allows the FTOs of the present invention
to target nucleic acid sequences having mixed purine/pyrimidine
sequences. FTOs according to the invention are useful for both in vitro
and in vivo modulation of gene expression.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.
